Phase 1 · Preparation
1 · Loading the data
read the transactions and labels,
reading the large table in batches
2 · Preparing the data
keep active-enough addresses, set aside hubs, split development and test,
store per-address transactions
Phase 2 · Execution
Building the representation
3 · Building the temporal graph
addresses as nodes, transfers as directed, timestamped edges
4 · Counting the motifs
count each motif per address, across seven windows (5 min to 1 week)
5 · Building the fingerprints
the motif fingerprint plus simpler features, as three views
Detection
6 · Running the detection
train a classifier per view, pick the window on development, measure on test
Analysis and reporting
7 · Analysing the results
compare views (RQ1), windows (RQ2), categories (RQ3), with statistical tests and orderings
8 · Visualising the results
write the tables and figures for the Results chapter
