Preparation
1. Load data
Read transfers and labels.
Stream large source tables.
2. Prepare data
Select targets and splits.
Store the required transfers.
Execution
3. Build temporal graphs
Keep direction, timestamps,
and repeated transfers.
4. Count local roles
Check validation templates.
Count at nine time windows.
5. Build fingerprints
Transform local role counts.
Add 17 baseline features.
6. Run detection
Select windows on development.
Evaluate held-out addresses.
7. Analyse results
Compare features and windows.
Test RQ1 to RQ4 across
seven timestamp orderings.
8. Report results
Write the tables and figures.
Record scores and uncertainty.
